

Bulkly — Bulk Messaging Automation Tool

Implementation Plan

Product Timeline

Version	Description
WhatsApp Text Generator	Initial concept; generated messages via copy-paste for manual sending
Bulkly V1	Automated the sending of copy-paste-generated messages via WhatsApp
Bulkly V2	Introduced systematic manual message input with a pre-configured time delay between sends
Bulkly V3	Currently in active development

Known Issues

The following limitations have been identified in the current version and are prioritized for resolution in Bulkly V3:

1. **Persistent Login Required** — Users are required to log in to WhatsApp on every application launch, creating a repetitive and friction-heavy experience.
2. **Unintended Retry on Startup** — Failed messages from previous sessions are automatically retried each time the application starts, causing unintended and potentially duplicate sends.
3. **No Message Length Limiter** — There is currently no character or message length restriction in place, which may lead to oversized or malformed messages being sent.
4. **No Send Limit Control** — The system does not support capping the number of successful message attempts. Users are currently unable to set a maximum

send threshold (e.g., stopping automatically after 40 successful sends), making controlled campaigns difficult to manage.

5. **Outbound-Only Functionality** — The tool is limited to bulk outbound messaging. It does not support reading or replying to inbound messages.
6. **Message Sequence Instability** — The message sending sequence breaks intermittently, particularly when the host PC enters sleep or idle mode, disrupting scheduled message flows.

Future Vision

The following enhancements are planned to evolve Bulkly into a robust, multi-platform messaging automation solution:

- **Greater Editability** — Allow users to fully customize message content beyond just the company or organization name — including addresses, phone numbers, and other dynamic fields — enabling broader use across different business contexts.
- **Smart Auto-Replies** — Equip the system with the ability to automatically respond to incoming messages, with contextual awareness of the client's tone, intent, and messaging style.
- **Multi-Platform Integration** — Expand support beyond WhatsApp to include all major Meta platforms, as well as TikTok, X (Twitter), and Telegram — consolidating all outreach into a single centralized messaging hub.
- **Customizable Message Themes** — Enable users to define the tone, style, and theme of outgoing messages, with content generation adapting dynamically to their preferences.
- **Session Persistence** — Implement a persistent login mechanism so users no longer need to re-authenticate on every application launch.
- **Bulk Group & Channel Addition** — Allow users to add multiple contacts to a WhatsApp Group or Channel simultaneously in a single streamlined action.
